### Research Summary

A biofeedback instrument is a device used in biofeedback therapy to measure and provide real-time feedback on physiological processes occurring within the body. It helps individuals gain awareness and control over involuntary bodily functions that are normally outside of conscious control. The instrument typically consists of sensors or electrodes that detect and measure specific physiological signals, such as heart rate, brainwaves, muscle tension, skin temperature, or respiratory patterns. The signals are then processed and displayed on a monitor or through auditory cues, allowing individuals to observe and learn to regulate their physiological responses. By receiving immediate feedback, individuals can learn to consciously manipulate their bodily functions, leading to improved self-regulation, stress reduction, pain management, and overall well-being. Biofeedback instruments are commonly used in clinical settings, sports training, and stress management programs.
