Research Summary

Bioherbicides are a type of herbicide derived from natural sources or based on living organisms that are used to control or suppress the growth of unwanted plants or weeds. Unlike conventional herbicides that are chemically synthesized, bioherbicides are typically formulated from naturally occurring substances such as plant extracts, microorganisms, or their byproducts. These bioherbicides work by interfering with the essential physiological processes of targeted weeds, inhibiting their growth, development, or reproduction. Bioherbicides offer several advantages over synthetic herbicides, including lower environmental impact, reduced toxicity to humans and non-target organisms, and potential for use in organic farming. However, it is important to note that the efficacy of bioherbicides can vary depending on factors such as weed species, application methods, and environmental conditions. Extensive research and development are ongoing to improve the effectiveness and application of bioherbicides as a sustainable weed control option in agricultural and horticultural practices.

The major global manufacturers of Bioherbicide include Marrone Bio Innovations,

BioHerbicides Australia, Emery Oleochemicals, HerbaNatur, Belchim Crop Protection, Koppert Biological Systems, WeedOUT, Premier Tech, Jiangsu Dongbao, etc. The global players competition landscape in this report is divided into three tiers.
