Research Summary

Biomass briquette fuel is a type of solid fuel made from compressed biomass materials, such as agricultural residues, forestry waste, or dedicated energy crops. It serves as a renewable and eco-friendly alternative to traditional fossil fuels for various heating and energy applications. Biomass briquettes are produced by compressing biomass materials under high pressure, often without the need for additional binders. The resulting briquettes have a consistent shape and size, making them convenient to handle, transport, and store. Biomass briquette fuel offers several advantages, including high energy density, efficient combustion, and lower greenhouse gas emissions compared to fossil fuels. It can be used in industrial boilers, domestic heating stoves, and power generation plants, helping to reduce carbon emissions and mitigate climate change. Biomass briquette fuel promotes sustainable resource utilization, waste management, and the development of local energy sources, contributing to a greener and more sustainable energy future.

The major global manufacturers of Biomass Briquette Fuel include German Pellets,
