Research Summary

Biomass briquettes are a type of fuel made from organic materials, such as agricultural residues, wood chips, sawdust, or even dedicated energy crops. They are produced by compacting these biomass materials under high pressure without the need for binding agents or chemicals. The process involves crushing the biomass to a consistent size, drying it to reduce moisture content, and then compressing it into a compact and uniform shape using a briquetting machine or mold. Biomass briquettes have a high energy density and can be used as a renewable and sustainable alternative to traditional fossil fuels. They are commonly used for heating purposes in homes, commercial settings, and industrial applications. Biomass briquettes offer numerous benefits, including reduced greenhouse gas emissions, efficient combustion, and utilization of agricultural and forestry residues, contributing to waste reduction and promoting environmental sustainability.

The major global manufacturers of Biomass Briquettes include German Pellets, Enviva, Pinnacle Renewable Energy Group, Pacific BioEnergy Corporation, Vyborgskaya Cellulose, Rentech, Graanul Invest Group, RWE Innogy, Lignetics, E-pellet, Drax
