### Research Summary

A biomass-fired heating plant is a facility that uses biomass as the primary fuel source to generate heat for various applications, such as space heating, water heating, or industrial processes. Biomass, typically in the form of wood chips, pellets, or agricultural residues, is burned in a biomass boiler or furnace, where the heat is released and transferred to a heat transfer fluid or directly to the heating system. The heat can be distributed through a network of pipes or used locally in a specific building or facility. Biomass-fired heating plants offer several benefits, including the utilization of renewable and sustainable fuel sources, reduced greenhouse gas emissions compared to fossil fuels, and potential cost savings. They can be an effective alternative to fossil fuel-based heating systems, especially in regions with abundant biomass resources. Biomass-fired heating plants contribute to a more sustainable and environmentally friendly approach to meeting heating needs while supporting local biomass industries and reducing reliance on non-renewable energy sources.

The major global suppliers of Biomassfired Heating Plant include EON, Dong Energy,

Drax Group, Aalborg, Comsa, Abantia, Aker Group, Fortum Keilaniemi, Eidsiva Fjernvarme, Suez, Statkraft, EHP, VATTENFALL, ZE PAK, MGT Power, etc. The global players competition landscape in this report is divided into three tiers.
