Research Summary

Biometric authentication and identification refers to the use of unique biological characteristics or behavioral patterns to verify and identify individuals. It involves the measurement and analysis of physiological or behavioral traits, such as fingerprints, facial features, iris patterns, voiceprints, hand geometry, or gait, to establish and authenticate an individual's identity. Biometric systems capture these traits using specialized sensors or devices, and the collected data is then compared against pre-registered templates or databases to determine a match. Biometric authentication offers several advantages over traditional authentication methods, such as passwords or PINs, as biometric traits are difficult to forge or replicate. It provides a higher level of security, convenience, and user-friendliness, as individuals can be authenticated by simply presenting their unique biometric features. Biometric technology is widely used in various applications, including access control systems, border security, mobile devices, banking, healthcare, and law enforcement. However, privacy concerns and the need for secure storage and handling of biometric data remain important considerations in the

deployment and implementation of biometric authentication and identification systems.

The major global suppliers of Biometric Authentication & Identification include IDEMIA, Thales, ASSA ABLOY, NEC, Fujitsu, Stanley Black & Decker, OneSpan, secunet, SpeechPro, Dermalog, Suprema, Securiport, Facebanx, Fulcrum Biometrics, M2SYS Technology, Aware, Daon, Ayonix Face Technologies, Cognitec Systems, etc. The global players competition landscape in this report is divided into three tiers.
