Research Summary

Bioresorbable medical materials, also known as biodegradable or absorbable materials, are specially designed materials that have the ability to degrade and be naturally absorbed by the body over time. These materials are used in various medical applications, such as surgical sutures, implants, tissue scaffolds, and drug delivery systems. They are typically made from biocompatible polymers, such as polyglycolic acid (PGA), polylactic acid (PLA), or their copolymers. The key advantage of bioresorbable materials is that they eliminate the need for surgical removal after the healing process, reducing the risk of complications and improving patient comfort. As the material degrades, it gradually releases any incorporated drugs or biologically active substances, facilitating controlled release and targeted therapy. Bioresorbable medical materials have revolutionized many areas of medicine, offering temporary support and treatment while allowing natural tissue regeneration and minimizing long-term foreign body reactions.

The major global manufacturers of Bioresorbable Medical Material include Evonik,

Corbion, DSM, Mitsui Chemicals, PCAS, Poly-Med, KLS Martin, etc. The global players competition landscape in this report is divided into three tiers.
