Research Summary

Bipolar electrodialysis (BPED) is an advanced water treatment technology that utilizes electrochemical processes to remove ions from water. In a BPED system, water flows through a series of alternating positively and negatively charged ion exchange membranes, known as bipolar membranes, under the influence of an applied electric field. As the water passes through the membranes, ions are selectively transported across the membrane stack, separating them from the water stream. Bipolar electrodialysis is particularly effective for removing ions such as salts, minerals, and other dissolved solids from water, making it useful for desalination, brackish water treatment, and purification of industrial wastewater streams. Compared to traditional desalination methods such as reverse osmosis, BPED systems can operate at lower energy consumption and require fewer pre-treatment steps, offering potential cost and efficiency benefits. Additionally, BPED systems can be modular and scalable, allowing for flexible deployment in various water treatment applications.

The major global manufacturers of Bipolar Electrodialysis (BPED) System include GE Water & Process Technologies (SUEZ), PCCell GmbH, Evoqua Water Technologies LLC, Astom, Mega, Lenntech, Shandong Tianwei, LANRAN, Beijing Tingrun, Hangzhou Bluestar, Xiamen Filter & Membrane Technology Co, etc. The global players competition landscape in this report is divided into three tiers.
