Research Summary

Bipolar forceps are surgical instruments used in various medical procedures, particularly in electrosurgery. They are designed to safely handle and manipulate tissues during surgical interventions that involve the use of electrical energy. Bipolar forceps consist of two tips or prongs that are electrically insulated from each other and connected to an electrosurgical generator. Unlike monopolar forceps, which require a separate grounding pad to complete the electrical circuit, bipolar forceps allow for controlled electrical current to pass directly between the tips. This design minimizes the risk of unintended tissue damage or electrical burns by confining the electrical current to the immediate area between the forceps tips. Bipolar forceps are commonly used in procedures such as cauterization, coagulation, and tissue sealing, where precise application of electrical energy is required to achieve hemostasis (stop bleeding) or manipulate tissues without damaging surrounding structures.

The major global manufacturers of Bipolar Forceps include B. Braun, Stryker, Sutter, Ethicon, BD, KSP, Medtronic, KLS Martin, Faulhaber Pinzetten, Integra LifeSciences,
