### Research Summary

Bipolar membranes are specialized membranes used in electrochemical processes, particularly in the field of electrodialysis. They are composed of multiple layers that consist of an anion exchange membrane (AEM) and a cation exchange membrane (CEM) with an interface layer in between. The purpose of bipolar membranes is to facilitate the splitting of water into hydrogen ions (H<sup>+</sup>) and hydroxide ions (OH<sup>-</sup>) through a process known as water electrolysis. When an electric current is applied to the bipolar membrane, it creates an electric field that drives the migration of ions. The anion exchange membrane allows the passage of negatively charged ions, while the cation exchange membrane allows the passage of positively charged ions. This selective permeability enables the separation of ions and the generation of acid and base solutions. Bipolar membranes are used in various applications, including water treatment, acid recovery, and the production of chemicals and fuels. They offer a more energy-efficient and environmentally friendly alternative to traditional methods of acid and base production.

The major global manufacturers of Bipolar Membranes include Asahi Kasei, SUEZ, ASTOM, Liaoning Yichen, Tingrun, etc. The global players competition landscape in this report is divided into three tiers.
