Research Summary

Bipolar plates are essential components used in fuel cells and electrolyzers. They serve as conductive pathways for the flow of electrons and facilitate the movement of ions between the anode and cathode compartments of the cell. Bipolar plates are typically made of materials that have good electrical conductivity and corrosion resistance, such as graphite, stainless steel, or composite materials. They feature channels or flow fields that allow for the distribution of reactant gases (such as hydrogen and oxygen in a fuel cell) and removal of reaction byproducts (such as water). The channels also provide a pathway for the efficient removal of heat generated during the electrochemical reactions. Bipolar plates play a crucial role in maintaining electrical connectivity, ensuring even distribution of reactants, minimizing voltage losses, and enhancing the overall performance and efficiency of the fuel cell or electrolyzer system.

The major global manufacturers of Bipolar Plates include Dana, Cell Impact, Schunk Group, Nisshinbo, FJ Composite, Ballard, ElringKlinger, VinaTech (Ace Creation), LEADTECH International, SGL Carbon, Shanghai Hongfeng, Dongguan Jiecheng
