### Research Summary

Bismuth is a chemical element with the symbol Bi and atomic number 83. It is a post-transition metal and one of the heaviest stable elements. Bismuth is known for its distinct silvery-white appearance and has a relatively low melting point, making it easy to work with. It is a brittle metal with a crystalline structure. Bismuth has several unique properties, including being one of the least toxic heavy metals, having a high electrical resistance, and exhibiting a strong diamagnetic effect (it repels magnetic fields). Bismuth and its compounds have various applications in industries such as cosmetics, pharmaceuticals, electronics, and alloys for low-melting-point applications. Bismuth is also sometimes used as a substitute for lead in certain applications due to its non-toxic nature.

The major global manufacturers of Bismuth include NIDC (DOE IP), NorthStar, etc. The global players competition landscape in this report is divided into three tiers. The first tier comprises global leading enterprises that command a substantial market share, hold a dominant industry position, possess strong competitiveness and influence, and generate significant revenue.
