Research Summary

Black pellets are a type of biofuel that is produced from biomass materials such as wood, agricultural residues, or energy crops. They are called "black" pellets due to their dark color, which is a result of the production process that involves torrefaction or carbonization. The biomass feedstock is subjected to high temperatures in the absence of oxygen, resulting in the removal of moisture and volatile compounds and the formation of a solid and energy-dense pellet. Black pellets have several advantages over traditional white wood pellets. They have a higher energy density, which means more energy can be stored and transported in a smaller volume. They also have improved resistance to moisture and can withstand longer storage periods without degrading. Black pellets are considered a renewable and sustainable energy source, as they are derived from biomass materials that can be replenished. They are used as a substitute for fossil fuels in heat and power generation, contributing to reduced greenhouse gas emissions and promoting a more environmentally friendly energy system.

The major global manufacturers of Black Pellets include Zilkha Biomass Energy, New

Biomass Energy, Bionet, Blackwood Technology, Arbaflame, Airex Energy, Bioebdev, ECN, etc. The global players competition landscape in this report is divided into three tiers.
