Research Summary

A blood and fluid warmer is a medical device designed to safely and efficiently warm blood and intravenous fluids to a desired temperature before they are administered to a patient. The device is commonly used in surgical settings, emergency departments, and intensive care units where patients may require blood transfusions or intravenous fluid therapy. The warmer typically consists of a heating element, a temperature control system, and tubing or cartridges to transport the fluids. The warming process helps prevent hypothermia and associated complications by maintaining the body temperature of the patient during infusion. It is especially important in critical situations and surgical procedures where cold fluids could cause vasoconstriction, impaired coagulation, and increased risk of surgical site infections. By ensuring that the fluids are delivered at an appropriate temperature, blood and fluid warmers contribute to patient safety, improve patient comfort, and support optimal patient outcomes.

The major global manufacturers of Blood and Fluid Warmer include Smiths Medical, Stryker, 3M, GE Healthcare, The Surgical Company, Baxter International, Barkey,
