Research Summary

A bonder is a precision machine used in microelectronics packaging and semiconductor manufacturing to electrically connect chips to package substrates or lead frames. Depending on the bonding method, bonders can be classified into types such as ball bonding, wedge bonding, and flip chip bonding, and are widely applied in the packaging processes of integrated circuits (ICs), LEDs, MEMS, and other devices. By precisely controlling parameters like pressure, temperature, time, and ultrasonic energy, bonders achieve high-precision and reliable connections, making them essential equipment for ensuring the performance and stability of microelectronic devices.
