### Research Summary

A bone densitometer, also known as a dual-energy X-ray absorptiometry (DXA) scanner, is a medical device used to measure bone mineral density (BMD) in a patient's body. It is primarily used to diagnose and monitor conditions such as osteoporosis, which is characterized by low bone density and increased risk of fractures. The densitometer works by emitting two low-dose X-ray beams of different energy levels that pass through the bones being examined. The amount of X-ray absorbed by the bone is measured, and this data is used to calculate the BMD. The results are typically presented as a T-score, which compares an individual's BMD to that of a young, healthy population, or as a Z-score, which compares it to a reference population of the same age and sex. Bone densitometry plays a crucial role in assessing bone health, guiding treatment decisions, and evaluating the effectiveness of interventions aimed at preventing or managing osteoporosis.

The major global manufacturers of Bone Densitometer include GE Healthcare, Hologic, Furuno Electric, Osteosys, DMS, Swissray (Norland), BeamMed, Scanflex Healthcare
