### Research Summary

A bone fixation plate is a medical device used in orthopedic surgeries to stabilize and support fractured or surgically repaired bones. It is typically made of metal, such as stainless steel or titanium, and features a flat, contoured design with multiple holes or slots for screws. The plate is positioned over the fractured bone and secured to the bone using screws, providing stability and immobilization during the healing process. The purpose of a bone fixation plate is to hold the fractured bone fragments in place, allowing proper alignment and preventing movement that could hinder the healing process. The plate acts as an internal scaffold, facilitating bone healing and providing structural support until the bone has fully healed. Depending on the specific case, the plate may be removed after bone healing or left in place permanently. The use of bone fixation plates has significantly improved the outcomes of fracture repair and bone reconstruction surgeries.

The major global manufacturers of Bone Fixation Plate include DePuy Synthes, Stryker, Zimmer Biomet, Smith & Nephew, Wright Medical, Medtronic, Tornier, NuVasive,
