Research Summary

A bone graft harvester is a specialized surgical instrument used in orthopedic procedures to harvest bone graft material from a patient's own body. The harvester is typically designed as a cylindrical or trephine-shaped tool with sharp cutting edges. During the procedure, the harvester is carefully inserted into the donor site, which is often the iliac crest of the hip bone. By rotating or applying pressure, the harvester cuts into the bone, removing a cylindrical core of bone tissue. This harvested bone can then be used as a graft material to fill defects or promote bone healing in other areas of the body. The bone graft harvester is designed to minimize trauma to the donor site while effectively extracting an adequate amount of viable bone for grafting purposes.
