### Research Summary

A bone harvester is a surgical instrument specifically designed for the extraction of bone graft material from a donor site. It typically consists of a handle and a working end with sharp cutting edges or teeth. The bone harvester is used in orthopedic and reconstructive procedures to harvest bone from various donor sites, such as the iliac crest, tibia, or fibula. The instrument is carefully maneuvered into the desired location, and with controlled pressure and rotational movements, it cuts and removes a portion of the bone. The harvested bone can then be utilized as a graft for bone defects, fractures, or other reconstructive purposes. The bone harvester is designed to minimize damage to surrounding tissues, provide efficient bone collection, and facilitate the successful transplantation of the harvested bone graft.
