### Research Summary

Boron-10 (B-10) is a stable isotope of boron, a chemical element found in nature. It is composed of 5 protons and 5 neutrons, giving it a total atomic mass of approximately 10 atomic mass units. Boron-10 is less common than the more abundant isotope, boron-11 (B-11). One of the most notable properties of boron-10 is its ability to absorb neutrons, making it valuable in nuclear applications, particularly in neutron capture therapy for treating cancer. In this therapy, boron-10 compounds are selectively delivered to tumor cells, where they capture thermal neutrons, leading to the release of energetic particles that destroy the cancer cells while sparing surrounding healthy tissue. Additionally, boron-10 is used in various other fields, including nuclear reactors, semiconductor industry, and as a dopant in materials science.

The major global manufacturers of Boron-10 include 3M, Stella Chemifa, Dalian Boronten Sci&Tech, NHTC, Liaoning Honghao Chemical, Heavy Water Board (HWB), Shandong Chengwu Yixin, etc. The global players competition landscape in this report is divided into three tiers. The first tier comprises global leading enterprises that

command a substantial market share, hold a dominant industry position, possess strong competitiveness and influence, and generate significant revenue. The second tier includes companies with a notable market presence and reputation; these firms actively follow industry leaders in product, service, or technological innovation and maintain a moderate revenue scale. The third tier consists of smaller companies with limited market share and lower brand recognition, primarily focused on local markets and generating comparatively lower revenue.
