Research Summary

A Boron Doped Diamond Electrode (BDD) is a type of electrode that incorporates boron atoms into a diamond lattice structure. It is a highly specialized electrode material known for its exceptional electrochemical properties and durability. The doping of boron atoms into the diamond lattice introduces conductive properties, transforming the insulating diamond into a highly conductive material. BDD electrodes exhibit several advantageous characteristics, including high chemical stability, wide electrochemical potential window, low background current, and resistance to fouling or degradation. These properties make BDD electrodes ideal for various electrochemical applications, such as water treatment, electroanalytical chemistry, electrocatalysis, and sensing. BDD electrodes are known for their ability to withstand harsh chemical environments, high temperatures, and prolonged usage, making them valuable tools in research and industrial settings where reliable and robust electrodes are required.
