Research Summary

Brain retractors are surgical instruments used in neurosurgery to gently separate and hold back brain tissue during brain surgery procedures. These specialized instruments are designed to provide access and visibility to the surgical site while minimizing damage to surrounding tissues. Brain retractors typically consist of a handle and blades that can be adjusted or positioned to retract specific areas of the brain. The blades are carefully inserted between brain tissue layers to create space, allowing surgeons to navigate and perform necessary procedures, such as tumor removal, aneurysm repair, or other neurosurgical interventions. The retractors are designed to be gentle and precise, exerting controlled pressure to prevent injury to the delicate brain tissue. They come in different sizes and shapes to accommodate various surgical approaches and patient anatomies. The use of brain retractors is essential in ensuring a clear and safe surgical field, enabling neurosurgeons to perform intricate procedures with improved visibility and access.
