Research Summary

Brazing materials refer to the various components used in the brazing process, which is a joining technique that involves melting a filler metal and using it to bond two or more base materials together. The filler metal used in brazing is typically a metal alloy with a lower melting point than the base materials being joined. Commonly used brazing materials include silver, copper, brass, bronze, and nickel alloys. These materials are selected based on their compatibility with the base metals, desired strength, temperature resistance, and other specific requirements of the application. Flux is another crucial brazing material, which is used to remove oxides and facilitate the flow of the filler metal during the brazing process. Additional materials such as flux cored wire, preforms, and pastes may also be used to enhance the brazing process, depending on the application and desired results.

The major global manufacturers of Brazing Materials include Lucas-Milhaupt, Senju, Wesgo Metals, Indium, IPG Photonics, Sentec-BIR, Harris Products, Wall Colmonoy, Tokyo Braze, Stella Welding, Umicore, Hangzhou Huaguang Advanced Welding
