Research Summary

A breast localization needle is a specialized medical instrument used in the process of preoperative marking and localization of breast lesions or abnormalities. It is typically a thin, hollow needle with a wire or other marker attached to the tip. The breast localization needle is inserted into the breast tissue, guided by imaging techniques such as mammography, ultrasound, or MRI. Once positioned near the target area, the marker or wire is deployed to mark the location of the lesion. This marking enables the surgeon to precisely identify and navigate to the target area during surgery, ensuring accurate removal or treatment of the abnormality while minimizing damage to surrounding healthy tissue. Breast localization needles play a vital role in guiding surgical interventions, such as lumpectomies or biopsies, and help improve the success and efficiency of breast procedures.
