Research Summary

Building materials refer to the substances or components used in the construction, renovation, or maintenance of buildings and structures. These materials serve as the foundation for the physical construction and play a crucial role in determining the strength, durability, functionality, and aesthetic appeal of the built environment. Building materials encompass a wide range of substances, including natural resources such as wood, stone, and clay, as well as synthetic materials like concrete, steel, glass, plastics, and composites. They can be categorized into structural materials (e.g., beams, columns, foundations), finishing materials (e.g., paints, coatings, flooring), insulation materials (e.g., thermal and acoustic insulation), and various other specialized materials based on specific requirements and applications. The selection of appropriate building materials is vital for ensuring structural integrity, safety, sustainability, energy efficiency, and overall performance of buildings.
