### Research Summary

Capacitance diaphragm gauges, also known as capacitive diaphragm gauges or CDG, are instruments used for measuring and monitoring pressure or vacuum levels in a wide range of applications. They operate based on the principle of changes in capacitance due to the deflection of a diaphragm under pressure. The gauge consists of a diaphragm, typically made of a thin metal or ceramic material, which flexes or moves in response to the applied pressure. The diaphragm acts as one plate of a capacitor, and the other plate is formed by a fixed electrode. As the diaphragm moves, the distance between the plates changes, resulting in a change in capacitance. This change in capacitance is then converted into an electrical signal, which is calibrated and displayed as a pressure or vacuum reading. Capacitance diaphragm gauges offer high accuracy, wide pressure range capability, and are suitable for both high and low-pressure measurements. They are commonly used in industries such as semiconductor manufacturing, vacuum technology, pharmaceuticals, and research laboratories, where precise pressure measurement is essential for process control and quality assurance.

The major global manufacturers of Capacitance Diaphragm Gauges include Inficon, MKS, Agilent, Setra, Pferffer, Canon Anelva, Leybold, ULVAC, Nor-Cal, Brooks, Thyracont, Kurt J.
