Research Summary

Capacitor banks are arrangements of multiple capacitors connected together in parallel to form a single unit. They are used in electrical power systems to provide reactive power support, improve power factor, and enhance voltage stability. Capacitor banks are typically composed of several individual capacitors, each with a specific capacitance rating, connected via switches or contactors. When switched on, the capacitors within the bank collectively store and release electrical energy to compensate for reactive power demand and reduce the overall reactive power drawn from the electrical grid. By improving power factor and reducing reactive power consumption, capacitor banks help increase the efficiency and capacity of power transmission and distribution systems, minimize voltage drops, and reduce energy costs for industrial and commercial consumers.

The major global manufacturers of Capacitor Banks include ABB, Schneider Electric, Eaton, GE, Siemens Energy, Sieyuan, Chint Group, Artech, SAMWHA, Alpes Technologies, Herong Electric, Shreem Electric, CIRCUTOR, Bree, Sun.King
