Research Summary

Capacitor film refers to a type of dielectric material used in the construction of capacitors, which are electronic components that store and release electrical energy. Capacitor films are typically made from thin layers of polymer materials, such as polyester (PET), polypropylene (PP), or polyethylene terephthalate (PET), that exhibit high dielectric strength, low dielectric loss, and good stability over a wide range of temperatures and frequencies. These polymer films are coated or metallized with a conductive material, such as aluminum or zinc, to form the capacitor electrodes. Capacitor films are used in various types of capacitors, including film capacitors, which are widely used in electronic circuits for applications such as filtering, coupling, and energy storage. They offer advantages such as high capacitance density, low leakage current, and long-term reliability, making them suitable for use in demanding applications across industries such as automotive, aerospace, telecommunications, and power electronics.

The major global manufacturers of Capacitor Film include Toray Industries, Inc., Bollor?
