Research Summary

A capillary rheometer is a device used to measure the flow properties and rheological behavior of fluids, particularly polymers and complex fluids, under specific conditions. It consists of a barrel with a cylindrical capillary die through which the fluid is forced to flow. The capillary rheometer applies a controlled pressure or force to the fluid, causing it to flow through the capillary. By measuring the pressure and the flow rate of the fluid, the rheometer can determine parameters such as viscosity, shear rate, and shear stress. Capillary rheometers are commonly used in research, development, and quality control processes in industries such as plastics, rubber, and food, where understanding the flow behavior of materials is critical for product design and process optimization.

The major global manufacturers of Capillary Rheometer include Malvern, Goettfert, Dynisco, Alpha, Instron, SHIMADZU, Thermo Fisher, Imatek, Changchun Intelligent Instrument Equipment, HUAYANG EQUIPMENT, etc. The global players competition landscape in this report is divided into three tiers.
