### Research Summary

Capsule endoscopy is a non-invasive diagnostic procedure that allows for visualization of the gastrointestinal (GI) tract using a small, swallowable capsule camera. The capsule camera, which is about the size of a large vitamin pill, contains a light source, a camera, and a transmitter. Once ingested, the capsule travels naturally through the digestive system, capturing high-quality images and videos of the GI tract. The images are wirelessly transmitted to a data recorder worn by the patient, which is later reviewed by a healthcare professional. Capsule endoscopy is primarily used to investigate and diagnose conditions such as obscure gastrointestinal bleeding, Crohn's disease, small intestine tumors, and other disorders of the small intestine that may not be adequately evaluated by conventional endoscopy or imaging techniques. It provides a minimally invasive and comprehensive examination of the small bowel, offering valuable insights into the presence of abnormalities, lesions, ulcers, and areas of inflammation.

The major global manufacturers of Capsule Endoscopy include Given Imaging, Olympus, RF, CapsoVision, Jinshan Science & Technology, IntroMedic, etc. The global
