Research Summary

Car batteries are electrical devices that provide the necessary power to start a car's engine and supply electricity to various electrical systems and components within the vehicle. They are rechargeable and store energy in the form of chemical reactions. Car batteries are typically lead-acid batteries, consisting of multiple cells containing lead plates submerged in an electrolyte solution of sulfuric acid. When the car's ignition is turned on, the battery delivers a surge of electrical current to the starter motor, enabling the engine to start. Once the engine is running, the alternator takes over and charges the battery while also powering the car's electrical systems. Car batteries also provide power to other components such as lights, radio, air conditioning, and power windows when the engine is off. The capacity of a car battery is measured in ampere-hours (Ah) and determines its ability to supply electrical energy over a period of time. Car batteries require periodic maintenance, such as checking the electrolyte levels and ensuring proper connections, to ensure their optimal performance and longevity. In case of a dead or weak battery, jump-starting or using a battery charger can restore its charge. Car batteries are crucial for the reliable operation of a vehicle's electrical systems and

play a vital role in powering the car's engine and supporting various electrical functions.

The major global manufacturers of Car Batteries include Johnson Controls, GS Yuasa, Exide Technologies, Hitachi Chemical, Camel Group, Sebang, Atlas BX, CSIC Power, East Penn, Banner Batteries, Chuanxi Storage, Ruiyu Battery, Exide Industries, Amara Raja, etc. The global players competition landscape in this report is divided into three tiers.
