Research Summary

Carburetors are mechanical devices used in internal combustion engines to mix fuel and air in the correct proportion for efficient combustion. They were widely used in older automobile engines before the introduction of fuel injection systems. The carburetor works by utilizing the venturi effect, where a narrowing in the carburetor's throat causes an increase in the air's velocity, creating a low-pressure area. This low-pressure area draws fuel from the fuel reservoir, typically a float bowl, through a series of jets and passages. The fuel mixes with the incoming air, creating a combustible mixture that is delivered to the engine's cylinders. The carburetor's design includes various components such as a throttle valve to control airflow, a choke for cold starting, and an idle circuit for engine idling. Carburetors require periodic adjustment and maintenance to ensure optimal engine performance. While modern vehicles predominantly utilize fuel injection systems, carburetors still find use in some small engines, motorcycles, and vintage vehicles.

The major global manufacturers of Carburetors include Keihin Group, Mikuni, Zama,

Walbro, Zhejiang Ruixing Electromechanical Technology, Fuding Huayi, TK, DELL'ORTO, Huayang Industrial, Fuding Youli, Bing Power, Zhejiang Ruili, Kunfu Group, etc. The global players competition landscape in this report is divided into three tiers.
