### Research Summary

A cardiac stent is a tiny, expandable mesh-like tube that is inserted into narrowed or blocked coronary arteries during a procedure called angioplasty. It is used to restore blood flow to the heart muscle in patients with coronary artery disease. The stent is typically made of metal, such as stainless steel or cobalt-chromium alloy, and is mounted on a deflated balloon catheter. The catheter is inserted into the blocked artery and guided to the site of the blockage. The balloon is then inflated, expanding the stent and pressing it against the artery walls, widening the narrowed area and allowing for improved blood flow. Once in place, the stent acts as a scaffold, keeping the artery open and preventing it from re-narrowing. Over time, the body's natural healing process covers the stent with cells, further supporting the arterial wall. Cardiac stents have significantly improved the treatment of coronary artery disease, reducing symptoms, improving quality of life, and lowering the risk of heart attack. Some stents are coated with medications to help prevent re-narrowing, a process called drug-eluting stents, which further enhance long-term outcomes.

The major global manufacturers of Cardiac Stent include Abbott Vascular, Boston

Scientific, Medtronic, Terumo, Lepu Medical, B.Braun, Biosensors, MicroPort, Atrium Medical, Biotronik, SINOMED, etc. The global players competition landscape in this report is divided into three tiers.
