Research Summary

A cardiotocograph (CTG) is a medical device used to monitor and record the fetal heart rate (FHR) and uterine contractions during pregnancy and childbirth. It consists of two main components: a transducer to measure and record the fetal heart rate and a tocodynamometer to monitor uterine contractions. The transducer is typically placed on the mother's abdomen to capture the fetal heart sounds, while the tocodynamometer is positioned to detect changes in uterine activity. The CTG provides continuous, non-invasive monitoring, allowing healthcare professionals to assess the well-being of the fetus and the progress of labor. It helps identify abnormal fetal heart rate patterns and uterine contractions that may indicate fetal distress or other complications. The CTG records this information in a graphical format, enabling healthcare providers to analyze and make informed decisions regarding the management of labor and delivery. The CTG is an essential tool in obstetric care, aiding in the monitoring and assessment of fetal well-being and contributing to safer childbirth outcomes.
