### Research Summary

Cardiovascular catheters are specialized medical devices used in interventional cardiology procedures to diagnose and treat various cardiovascular conditions. These catheters are thin, flexible tubes made of materials such as plastic or polymers, designed for insertion into blood vessels through a small incision or puncture in the skin. Diagnostic cardiovascular catheters are equipped with imaging technologies such as angiography, intravascular ultrasound (IVUS), or optical coherence tomography (OCT) to visualize blood vessels, heart chambers, and surrounding structures. Therapeutic cardiovascular catheters are used for interventional procedures such as angioplasty, stent placement, cardiac ablation, and drug delivery to treat conditions like coronary artery disease, arrhythmias, and structural heart defects. Cardiovascular catheters play a crucial role in modern cardiology, enabling minimally invasive treatments with reduced risks and faster recovery times compared to traditional open surgeries.
