Research Summary

Cassava pulp, also known as cassava bagasse or cassava residue, refers to the fibrous material remaining after the extraction of starch from cassava roots. It is a byproduct of cassava processing, where the starchy tuber is crushed, washed, and sieved to separate the starch from the fibrous residue. Cassava pulp consists of the cellulose, hemicellulose, and lignin components of the cassava plant, along with small amounts of residual starch and other organic matter. It is typically moist and has a fibrous texture. Cassava pulp has various applications in different industries. In animal feed, it can be used as a source of dietary fiber or as an ingredient in livestock rations. It can also be used as a substrate for the production of biogas through anaerobic digestion, contributing to renewable energy generation. In some cases, cassava pulp can be further processed to extract additional value-added products, such as ethanol or bio-based materials. Overall, cassava pulp plays a role in optimizing the utilization of cassava roots and reducing waste in the cassava processing industry.
