Research Summary

Casting and splinting products are medical devices used in orthopedic care to immobilize and support injured bones, joints, or soft tissues during the healing process. Casts are rigid structures typically made from materials like plaster or fiberglass that encase a body part, providing stabilization and immobilization to promote proper healing. Splints, on the other hand, are often made of lightweight materials like foam or plastic and provide a less rigid support while allowing for some movement. These products are used in the treatment of fractures, sprains, strains, and other musculoskeletal injuries. They are applied by healthcare professionals trained in casting and splinting techniques, who carefully mold the material to fit the contours of the patient's affected area. The casting and splinting process involves selecting the appropriate size and type of product, applying padding for comfort and protection, and securing the cast or splint with bandages or fasteners. These products help immobilize the injured area, reduce pain, prevent further damage, and aid in the healing process by providing support and stability. They are an essential component of orthopedic care and rehabilitation, allowing patients to recover and regain function while protecting the

injured body part.
