Research Summary

A CCD (Charge-Coupled Device) camera and a CMOS (Complementary Metal-Oxide-Semiconductor) camera are two types of digital cameras that use different image sensor technologies. A CCD camera utilizes a CCD sensor to capture and convert light into electrical signals. CCD sensors offer excellent image quality, high sensitivity, and low noise levels, making them well-suited for applications that require high-resolution and low-light performance. On the other hand, a CMOS camera uses a CMOS sensor that has individual amplifiers for each pixel. CMOS sensors are known for their lower power consumption, faster readout speeds, and cost-effectiveness. While CMOS cameras initially had limitations in image quality, advancements in technology have narrowed the gap, and they are now commonly used in a wide range of consumer electronics, including smartphones, digital cameras, and surveillance systems. Both CCD and CMOS cameras have their advantages and are suitable for various applications based on their specific characteristics and performance requirements.

The major global manufacturers of CCD and CMOS Camera include Canon, Sony,
