### Research Summary

CCD (Charge-Coupled Device) and CMOS (Complementary Metal-Oxide-Semiconductor) sensors are two types of image sensors used in digital cameras and other imaging devices. Both CCD and CMOS sensors are responsible for capturing and converting light into electrical signals for the formation of digital images. CCD sensors use a complex arrangement of pixels to collect and transfer charges from each pixel to the sensor's output amplifier, resulting in high-quality images with low noise levels. CMOS sensors, on the other hand, use a different approach where each pixel has its own amplifier, allowing for faster readout speeds and lower power consumption. CMOS sensors are typically more cost-effective to manufacture and are commonly found in smartphones and consumer-grade cameras. While both CCD and CMOS sensors have their advantages and disadvantages, both play a crucial role in capturing images in digital photography and imaging applications.

The major global manufacturers of CCD and CMOS Sensors include Agilent Technologies, Alcatel-Lucent (Nokia Group), Broadcom, Cmosis, Coherent, E2V
