Research Summary

Cellulose acetate reverse osmosis membrane, also known as CA RO membrane, is a type of semi-permeable membrane used in reverse osmosis (RO) water purification systems. It is made from cellulose acetate, a derivative of cellulose, which is a natural polymer found in the cell walls of plants. The CA RO membrane is engineered to allow the passage of water molecules while blocking the majority of dissolved salts, minerals, and contaminants present in the water. During the reverse osmosis process, water is forced through the membrane under pressure, separating pure water from impurities and producing high-quality, purified water suitable for various applications, such as drinking water, industrial processes, and desalination of seawater. The performance and efficiency of the cellulose acetate reverse osmosis membrane depend on its composition, thickness, and surface properties, making it an essential component in modern water treatment technologies.
