Research Summary

A central vascular access device (CVAD) is a medical device used to access and deliver fluids, medications, or nutrition directly into a patient's bloodstream. It is inserted into a central vein, usually the superior vena cava or the subclavian vein, to allow for the administration of treatments or the collection of blood samples. CVADs can be classified into different types, including central venous catheters (CVCs), peripherally inserted central catheters (PICCs), and implantable ports. These devices are typically composed of a catheter that is inserted into the vein and attached to an external hub or port. The hub or port can be accessed with a needle or connector for the delivery or withdrawal of fluids. CVADs are commonly used in patients who require long-term intravenous therapy, frequent blood sampling, or for those with limited peripheral venous access. They provide a reliable and efficient means of delivering medications and fluids, monitoring the patient's condition, and minimizing the need for repeated venous access procedures. Proper care and maintenance of CVADs are crucial to prevent complications such as infections or thrombosis.

The major global manufacturers of Central Vascular Access Device include Becton Dickinson, C. R.
