Research Summary

Central venous access devices (CVADs) are medical devices used to access and deliver fluids, medications, or other treatments directly into a patient's central venous system. They are inserted into a large central vein, such as the subclavian vein or jugular vein, to provide long-term venous access. CVADs are designed to remain in place for an extended period, reducing the need for repeated needle sticks and peripheral venous access. They can be categorized into various types, including central venous catheters (CVCs), peripherally inserted central catheters (PICCs), and implantable ports. These devices consist of a catheter that is inserted into the vein and attached to an external hub or port. The hub or port can be accessed with a needle or connector for the administration of fluids, medications, blood products, or the collection of blood samples. CVADs are used in a variety of clinical settings, such as intensive care units, chemotherapy, long-term antibiotic therapy, and parenteral nutrition. They provide a reliable and efficient means of delivering treatments, monitoring the patient's condition, and minimizing the discomfort associated with frequent venous access. Proper care and maintenance of CVADs are essential to prevent complications such as

infections or thrombosis.
