### Research Summary

A centralized patient monitoring system is a comprehensive and integrated healthcare technology that allows for continuous monitoring and management of patient data in a centralized location. It involves the use of various monitoring devices, such as physiological monitors, bedside monitors, or wearable sensors, which collect real-time patient information, including vital signs, electrocardiograms, oxygen saturation levels, and other relevant parameters. The collected data is transmitted to a centralized monitoring station or a computerized system where healthcare providers can monitor multiple patients simultaneously, analyze trends, and make informed decisions about patient care. The system often includes alarms and alerts that notify healthcare professionals of any abnormal readings or critical situations requiring immediate attention. Centralized patient monitoring systems enhance patient safety, improve response times, and enable healthcare teams to provide proactive and timely interventions, especially in intensive care units, post-anesthesia care units, or other high-acuity settings. They promote efficient communication and facilitate collaborative care

by consolidating patient data and making it easily accessible to healthcare providers in real-time.
