Research Summary

A centrifugal refrigeration compressor is a type of compressor specifically designed for use in refrigeration systems. It operates based on the principle of centrifugal force to compress refrigerant gases and facilitate the cooling process. The compressor consists of a rotating impeller with curved blades that draw in the refrigerant gas and accelerate it outward using centrifugal force. As the gas moves through the compressor, its velocity increases, resulting in a rise in pressure. The refrigerant then enters a diffuser section, where the velocity is reduced, and the pressure is further increased. This compressed refrigerant is then sent to the condenser for heat rejection and subsequent cooling. Centrifugal refrigeration compressors are known for their high energy efficiency, large capacity, and low maintenance requirements, making them suitable for large-scale industrial refrigeration applications, such as air conditioning systems in commercial buildings, industrial cooling processes, and large-scale refrigeration plants.

The major global manufacturers of Centrifugal Refrigeration Compressor include
