### Research Summary

A ceramic dipping former, also known as a ceramic mold or ceramic former, is a tool used in ceramic manufacturing processes to shape and form ceramic objects through the dipping method. It is typically made from a durable ceramic material, such as plaster or refractory material, and is designed to have the desired shape and dimensions of the final ceramic product. The ceramic dipping former is immersed into a liquid ceramic slip or glaze, allowing the material to adhere to its surface. After withdrawal from the slip, the excess material is drained off, leaving a thin layer of ceramic on the former. The ceramic coating dries and hardens on the former, forming a shell or layer that can be subsequently fired in a kiln to achieve the desired strength and characteristics. Ceramic dipping formers are used in various industries, including pottery, tableware, sanitaryware, and ceramic art, to create consistent and uniform shapes for production or artistic purposes. They play a crucial role in the precise control of ceramic thickness and the formation of intricate designs and patterns.

The major global manufacturers of Ceramic Dipping Former include CeramTec,
