### Research Summary

Ceramic frit is a glassy material made from a mixture of ceramic powders and various inorganic compounds. It is commonly used in the production of ceramic and glass products, particularly in the field of ceramics and glazing. Ceramic frit is created by melting the raw materials together at high temperatures and then rapidly cooling them to form a solid glassy substance. The frit is typically ground into a fine powder and then mixed with other ingredients to create glazes or coatings that can be applied to ceramic surfaces. When fired in a kiln, the frit undergoes a process of vitrification, transforming into a smooth and durable glass-like coating that adheres to the ceramic surface. Ceramic frit can provide aesthetic effects, such as color, texture, and sheen, as well as functional properties, including resistance to moisture, chemicals, and UV radiation. It finds applications in various industries, including architecture, tableware, tiles, and decorative ceramics, enabling the creation of visually appealing and durable ceramic products.

The major global manufacturers of Ceramic Frit include Ferro, Colorobbia, Esmalglass-Itaca, QuimiCer, Torrecid Group, TOMATEC, Johnson Matthey, Fusion Ceramics, T&H
