### Research Summary

Cerebral embolic protection devices (EPDs) for transcatheter aortic valve implantation (TAVI) are specialized medical devices designed to reduce the risk of stroke during the TAVI procedure. TAVI is a minimally invasive procedure used to replace a diseased aortic valve in patients with severe aortic stenosis. During the TAVI procedure, a new valve is delivered to the heart through a catheter and deployed within the native aortic valve. However, the manipulation of the catheter can dislodge small debris, called emboli, which can travel to the brain and cause a stroke. Cerebral embolic protection devices act as filters or traps to capture these emboli, preventing them from reaching the brain and causing harm. By providing an added layer of protection against stroke, these devices contribute to improved safety and outcomes for patients undergoing TAVI procedures, particularly for those who may be at higher risk for embolic events.

The major global manufacturers of Cerebral Embolic Protection Devices for TAVI include Boston Scientific (Claret Medical), Venus Medtech (Keystone Heart),
