Research Summary

Cervical interbody fusion cages are medical devices used in spinal surgeries to treat degenerative conditions, herniated discs, or instability in the cervical spine (neck). They are inserted between two adjacent vertebrae in the cervical region to restore height and alignment, decompress nerves, and promote spinal fusion. Cervical interbody fusion cages are typically made of biocompatible materials, such as titanium or polyetheretherketone (PEEK), which can integrate with surrounding bone over time. The cages provide a spacer between the vertebrae, maintaining disc space and facilitating bone growth through the cage. This encourages the fusion of the two vertebrae, stabilizing the spine and reducing pain caused by movement or nerve compression. The use of cervical interbody fusion cages is considered a standard surgical approach for certain cervical spine disorders, aiming to improve patients' quality of life and restore neck function.

The major global manufacturers of Cervical Interbody Fusion Cages include Medtronic, Depuy Synthes, Stryker, Zimmer Biomet, BBraun, NuVasive, Globus Medical, K2M,
