### Research Summary

A chain block, also known as a chain hoist or manual chain hoist, is a mechanical device used for lifting and lowering heavy loads in various industries and construction sites. It consists of a chain that is looped around a pulley system and attached to a hook or lifting point. The chain block operates by pulling the hand chain, which activates the gear and pulley mechanism, allowing the chain to move through the hoist and lift the load. The device is designed for manual operation and requires physical effort to raise or lower the load. Chain blocks are available in different lifting capacities and configurations, making them versatile and suitable for a wide range of lifting applications. They are widely used in warehouses, workshops, factories, and construction sites where a compact and portable lifting solution is needed, and electric or hydraulic hoists may not be feasible or available. Proper training and adherence to safety guidelines are essential when using a chain block to ensure safe and efficient lifting operations.

The major global manufacturers of Chain Block include Columbus McKinnon, KITO, Konecranes, Terex, Hitachi Industrial, TBM, Ingersoll Rand, TOYO, Shanghai yiying,
