Research Summary

Chelate resins are a type of ion exchange resin with a specific functional group that forms stable complexes, or chelates, with metal ions. These resins are designed to selectively remove and recover metal ions from solutions or aqueous environments. The functional groups on chelate resins are typically iminodiacetate (IDA), aminomethylphosphonic acid (AMPA), or other similar ligands that can coordinate with metal ions. Chelate resins are widely used in various industrial applications, including water treatment, mining, metal recovery, and chemical processing, where they play a crucial role in removing trace metals and contaminants from wastewater or process streams. The ability of chelate resins to form strong and reversible metal complexes makes them highly effective in selective metal ion extraction and separation processes.

The major global manufacturers of Chelate Resins include DuPont, LANXESS, Purolite, Mitsubishi Chemical, ResinTech, Sunresin, Suqing Water Treatment, Zhejiang Zhengguang, Zibo Dongda Chemical, Chengdu Nankai, Shanghai Kaiping, Thermax, etc. The global players competition landscape in this report is divided into three tiers.
